

EXCLUSIVE J/ψ WITH GLUEX

By: Dr. Donovan Ebersole

Quantum Chromodynamics

- Quantum Chromodynamics (QCD)- theory of quarks and gluons.
- Predicts rich spectrum of hadrons, groups of quarks bound by gluons
- The proton
 - One of the building blocks of matter*
 - A baryon with up-up-down quark content.*
- Charmonium
 - charm and anticharm quark pair*
 - J/ψ - first excited state ($n^{2S+1}L_J = 1^3S_1$)*

Proton

Charmonium- J/ψ

Proton Charge and Mass Radius

- Proton Charge Radius
 - *Electron/muon scattering experiments*
 - *Electromagnetic form factors*
- Proton Mass- dominated by distribution of gluons
- Proton Mass Radius
 - *Electron/muon scattering can't probe gluonic contributions*
- How can J/ψ help?
 - *Charm quarks predicted to interact via gluonic exchange with proton*
 - *Could probe into the gluonic distribution in the proton*
 - *Gluonic interaction is suggested to dominate at the J/ψ threshold*

Assumptions of Gluonic Interaction

- Vector Meson Dominance
 - *Model describes photon-hadron interactions*
 - *Suggests photons oscillate into vector meson ($\rho, \omega, \phi, J/\psi$) that interact with proton*
 - *Possibly breaks down for heavier quarks*
- Factorization
 - *Assumes gluonic interaction can factorize into an upper, “hard” part and a lower, “soft” part*
 - “Hard” part- described by QCD
 - “Soft” part- described by generalized parton distribution functions (GPDs)
- Dominant interaction at Threshold
 - *Assumes no s-channel or loop contributions*

Models in J/ψ Photoproduction Dynamics

JPAC arxiv:2305.01449 (2023)

- Kharzeev et al. (PRD 104 (5 Sept. 2021), p. 054015) calculated proton mass radius from slope of $\frac{d\sigma(\gamma p \rightarrow J/\psi p)}{d(-t)}$
 - assumed an elastic interaction between the J/ψ and the proton
- However, open-charm intermediate states could contribute
 - Violate assumptions of gluonic exchange

- A National Laboratory located in Newport News, Virginia
- Hosts the Continuous Electron Beam Accelerator Facility (CEBAF)
- GlueX located in Hall D
 - *Receives 12 GeV electrons after 5.5 turns through CEBAF*
 - *Electron beam hits a diamond radiator*
 - *Producing a linearly polarized beam of photons via Bremsstrahlung radiation*

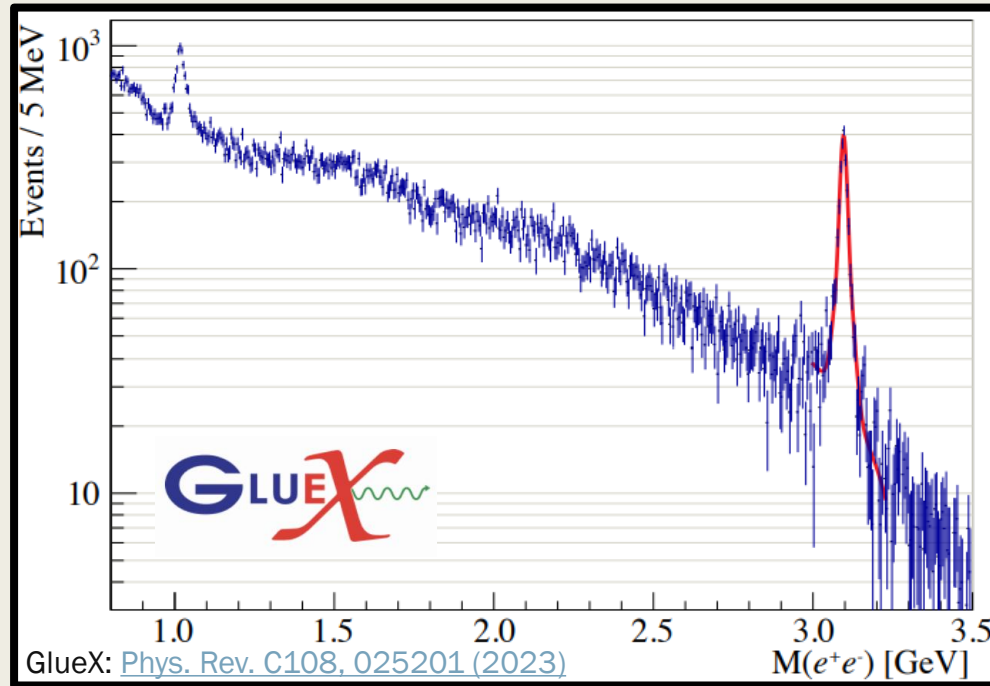

The GlueX Spectrometer

- Photon beam incident onto a fixed liquid hydrogen target
- The spectrometer,
 - Near 4π coverage
 - Composed of several sub-detectors and a solenoid magnet
 - Can detect a wide range of neutral and charged particles
- Tracking:
 - $\frac{\sigma_x}{p} \sim 1 - 5 \%$
- Calorimetry:
 - $\frac{\sigma_E}{E} \sim \frac{6\%}{\sqrt{E}} \oplus 4.5 \%$

GlueX NIM- [NIM A 987 \(2021\) 164807](#)

Exclusive $\gamma p \rightarrow J/\psi p \rightarrow e^+ e^- p$ at GlueX

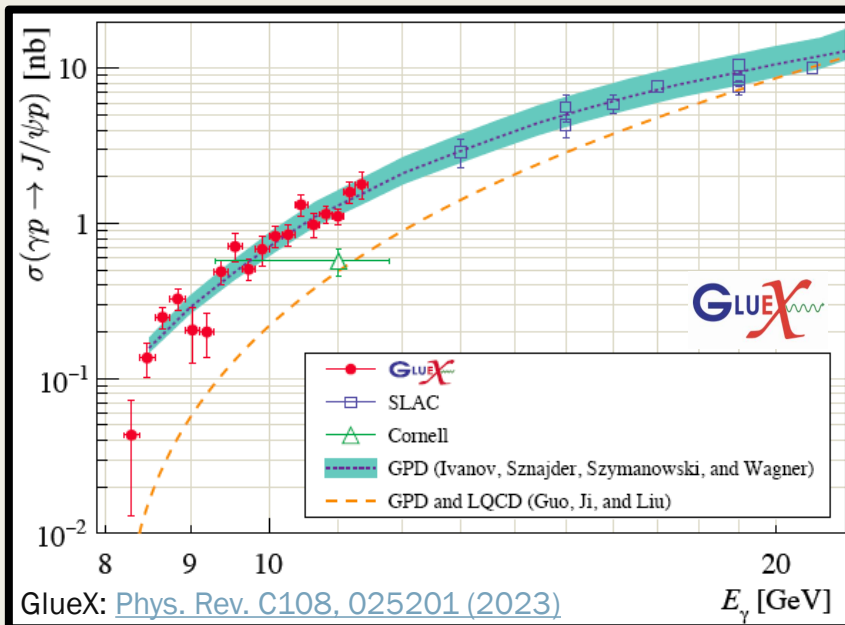

- Exclusivity of the reaction: kinematic fit
- 13 MeV mass resolution
- J/ψ yields extracted from fits of distributions - $2270 \pm 58 J/\psi$'s
- BH(1.2 – 2.5 GeV) used for normalization

Threshold region coverage

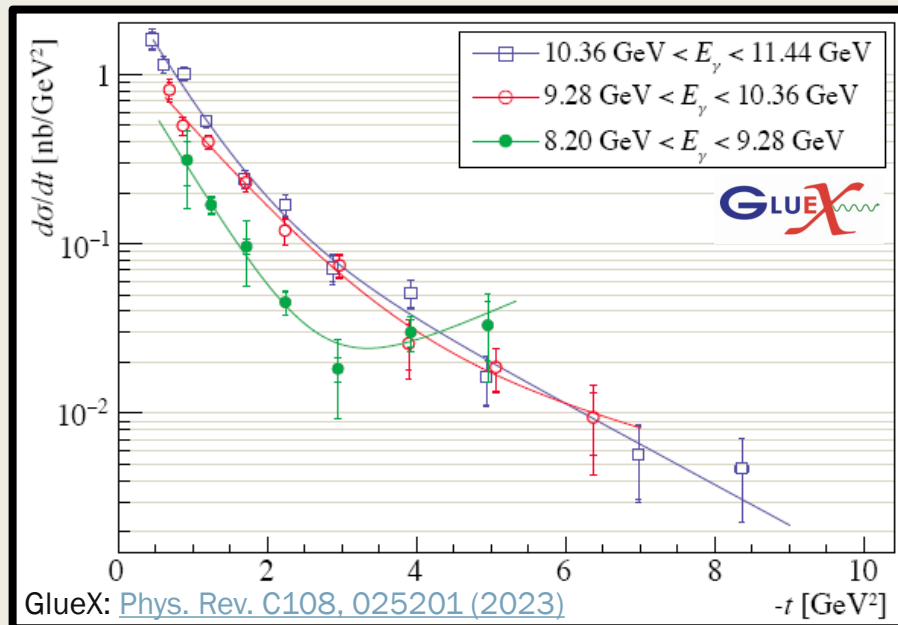

- Event-by-event weighting by luminosity
- Dots - mean energy and t-value for the corresponding bin
- Results reported at mean energy for corresponding slice
- Deviations due to bin averaging included in the systematic errors

GlueX results: $J/\psi \rightarrow e^+e^-$ total and differential cross-sections

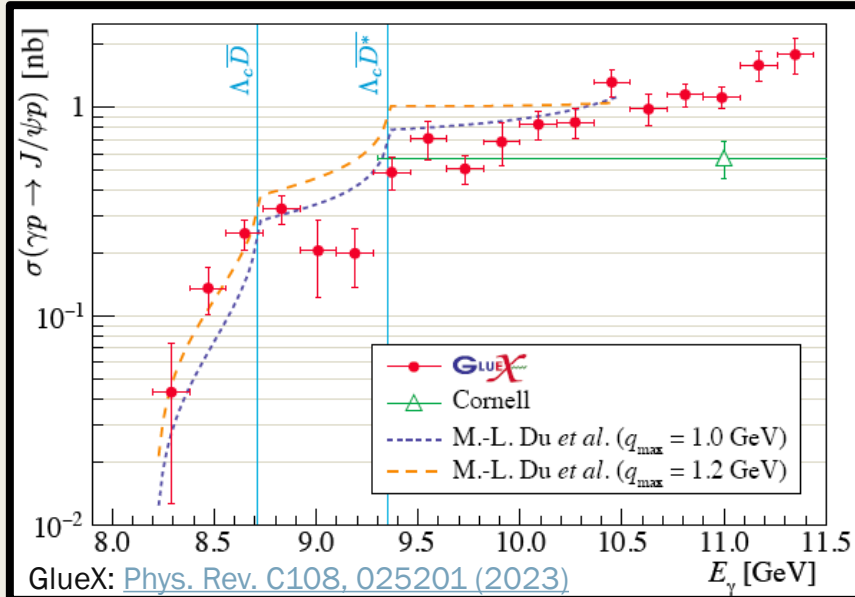

- σ_{tot} increasing with energy approximately following the phase space
- Possible structure at $\sigma(8.6 - 9.6 \text{ GeV})$
 - 2.6σ - statistical significance of the two “dip” points
 - 1.3σ - using look-elsewhere method

- $\frac{d\sigma}{dt}$ exponentially falling with t -dependence
- Enhancement of $\frac{d\sigma}{dt}$ at high t (for the lowest energy slice), indicates contribution beyond gluon exchange

Other reaction mechanisms: open-charm, 5q exchange

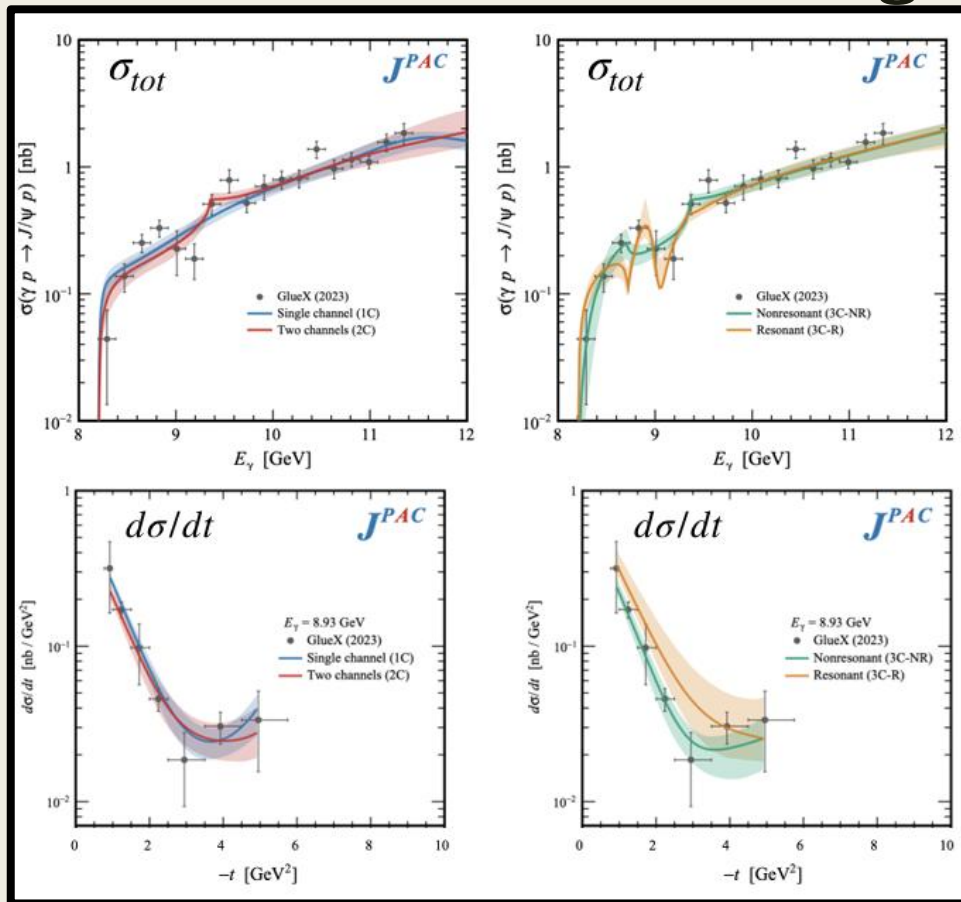

Du et al. EPJ C80 (2020)

Strakovsky et al. arxiv:2304.04924 (2023)

Gluon or charm exchange: JPAC interpretation

Phenomenological model based on s-channel PW expansion ($l \leq 3$):

- (1C) $J/\psi p$ interaction
- (2C) $J/\psi p$ and $\bar{D}^* \Lambda_c$
- (3C-NR) $J/\psi p$, $\bar{D}^* \Lambda_c$, $\bar{D} \Lambda_c$ (non-resonant solution)
- (3C-R) $J/\psi p$, $\bar{D}^* \Lambda_c$, $\bar{D} \Lambda_c$ (resonant solution)

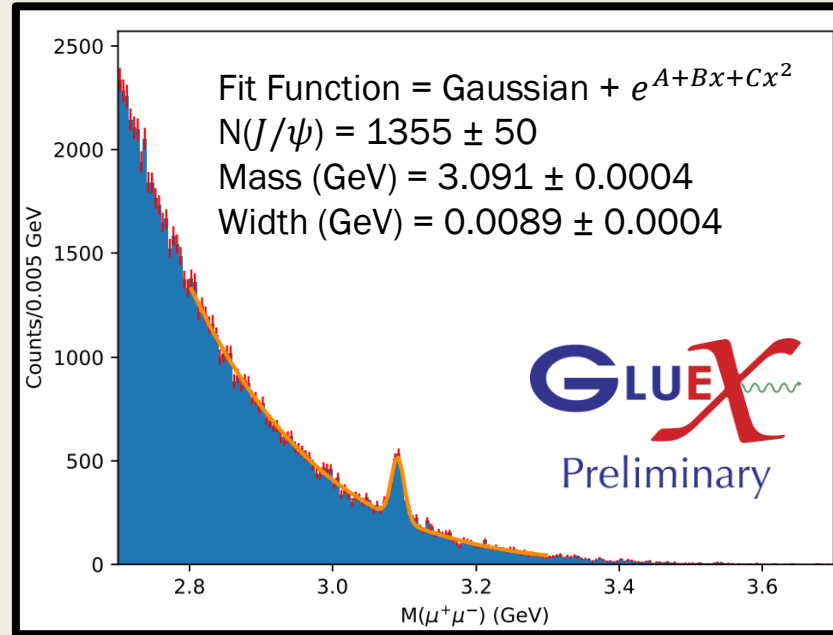

No stat. significant preference:

- 9 GeV structure requires sizable contribution from open charm
- Severe violation of VMD and factorization not excluded
- s-channel resonance not excluded
- t-enhancement indicates s-channel contribution: due to proximity to threshold or open-charm exchange

Why $J/\psi \rightarrow \mu^+ \mu^-$ at GlueX?

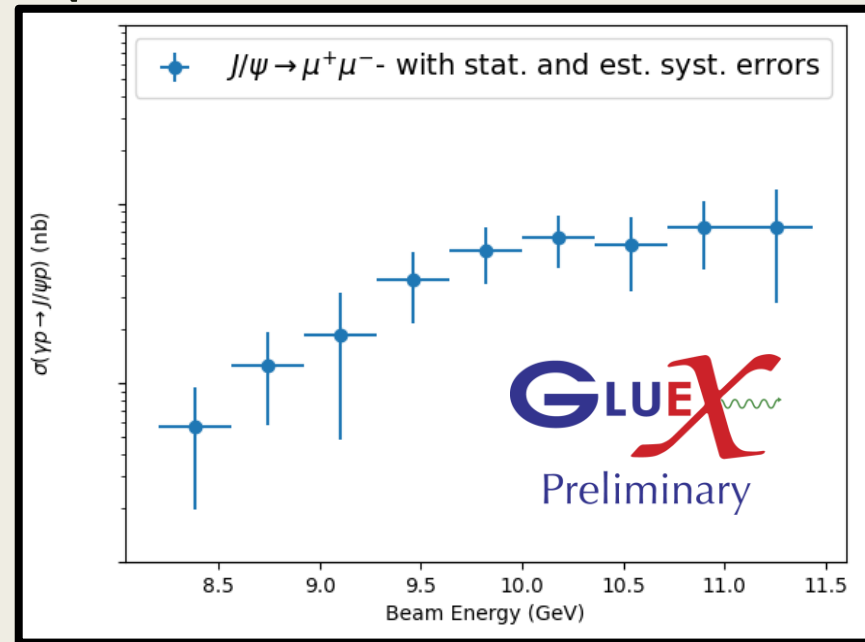

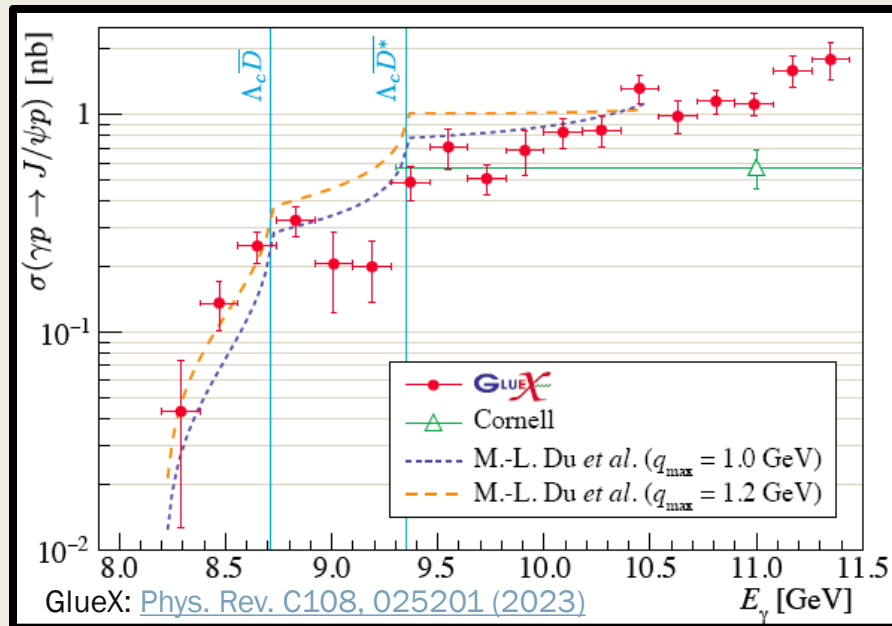

- Branching ratios are the same for both channels
 - *Increase our J/ψ statistics*
- Large ($\sim 20\%$) normalization uncertainty in $J/\psi \rightarrow e^+ e^-$ cross section
 - Primarily from the relative measurement to *Bethe-Heitler* process
- $J/\psi \rightarrow \mu^+ \mu^-$
 - Absolute cross section measurement
 - Could help reduce this normalization uncertainty
 - *Detector response to the electrons and muons is different*
 - *Can be used as a cross check for the behavior seen in the total and differential cross sections*

Exclusive $\gamma p \rightarrow J/\psi p \rightarrow \mu^+ \mu^- p$ at GlueX

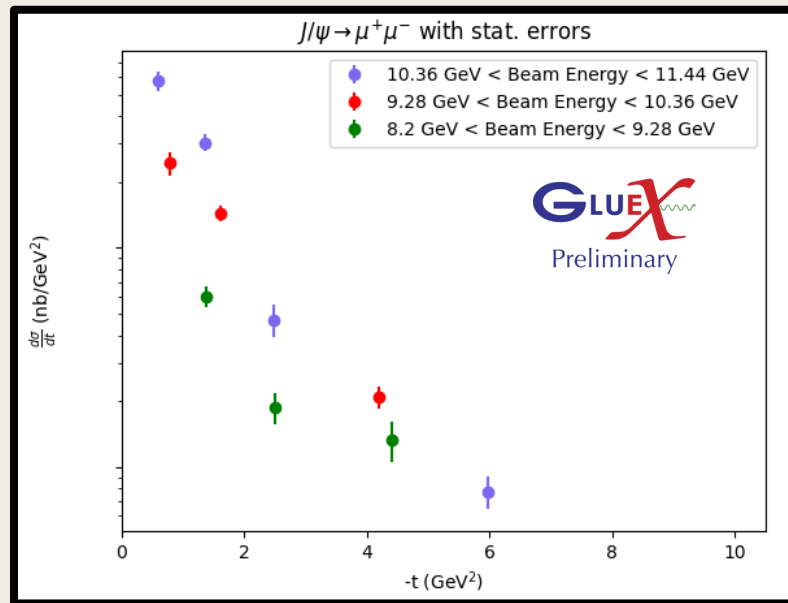

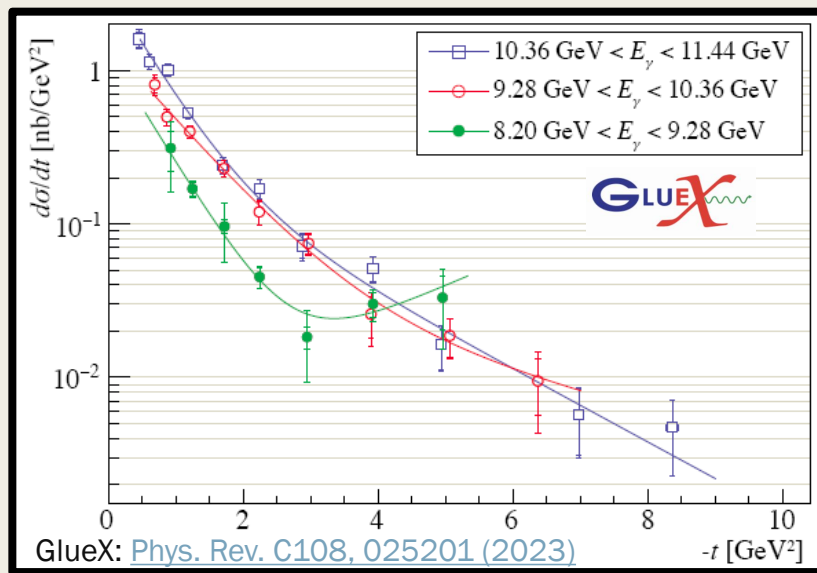

- Exclusivity of the reaction: kinematic fit- forces exclusivity and p^μ conservation
- Use energy deposition in calorimeters for particle identification
- Use opening angle between muons to remove large baryon background
 - Pions misidentified as muons \rightarrow one pion at greater angle in baryon decays
- Mass distribution- Observed yield after selections
 - No efficiency correction

Comparing e^+e^- and $\mu^+\mu^-$ cross sections

- Cross section with statistical and preliminary systematic uncertainties
 - Large systematic uncertainties in $\mu^+\mu^-$ cross section
- Measurements are consistent in general shape
 - Normalization uncertainty in $\mu^+\mu^-$ cross section

Comparing e^+e^- and $\mu^+\mu^-$ differential cross sections

- Just statistical uncertainty for $\mu^+\mu^-$
 - Systematic uncertainties not included but contributes greatly to uncertainties
- See a flattening at low beam energy and high- t in both channels
- Normalization uncertainty in $\mu^+\mu^-$ cross section

Future at GlueX- Approved Phase-III Proposal

Run Period	PAC Days	J/ψ Yield
All Phase I	120	2,180
2020 Phase II	67.5	1,780
2023 Phase II	28.1	741
2024-2025 Phase II (planned)	109	2,874
This Proposal	200	11,271
Projected Total		18,846

Proposal # PR12-24-006 for PAC52

- Currently in Phase-II
 - *Should triple the e^+e^- published statistics (Just Phase-I)*
 - *Doubles the $\mu^+\mu^-$ statistics (Phase-I + 2020 Phase-II)*
- Approved for Phase-III
 - *Twice the Phase-I and Phase-II photon beam intensity*
 - *Should J/ψ double the combined Phase-I and Phase-II statistics*
 - *Predicts a high likelihood that added GlueX-III data could rule out the 1C model at the 5σ level*

Summary

- Summary:
 - *Successfully calculated a total and differential cross section of the reaction $\gamma p \rightarrow J/\psi p$ both leptonic decays*
 - *Possible dip structure at $\sigma(8.6 - 9.6 \text{ GeV})$ in e^+e^- channel*
 - *Flattening of diff. cross section at high- t in both channels*
 - *Helps distinguish between J/ψ photoproduction models*
- Future Work:
 - *Large increase in data over next few years*
 - *Phase-III predicted to rule out the $1C$ ($J/\psi p$ interaction) model at the 5σ level*

Back up slides

Previous Measurements: SLAC and Cornell

- SLAC and Cornell- First J/ψ photoproduction measurements at energies near threshold
- Both experiments predominantly used nuclear targets
- Both experiments had only inclusive measurements since they did not detect the recoiling proton
 - *Because of this, they both have access to a limited range of Mandelstam- t values, which leads to greater systematic uncertainties in their measurement.*
- These measurements were also done at least 1.5 GeV above the J/ψ threshold.

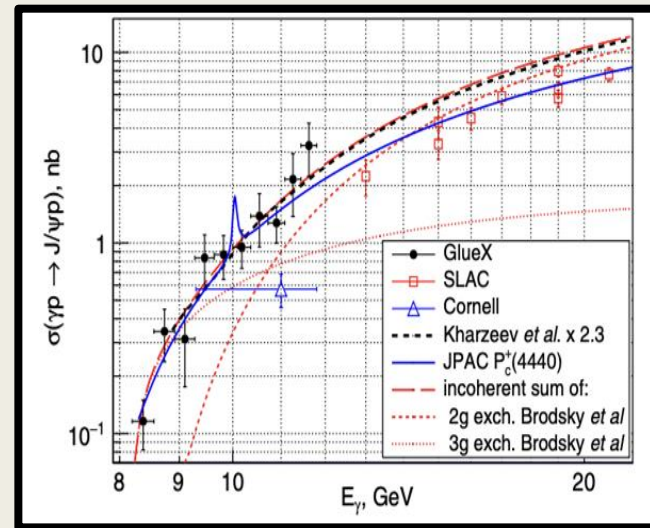

Brodsky et al.: PLB 498 (2001), pp. 23–28

Previous Measurements: GlueX Collaboration (1st Publication)

- GlueX- published measurements of the $\gamma p \rightarrow J/\psi p$ cross-section through the decay of $J/\psi \rightarrow e^+ e^-$
 - *Total integrated luminosity 68pb^{-1} at or above the J/ψ threshold*
- Relative cross-section measurement to the Bethe-Heitler process
 - *This contributes significantly to a large ($\sim 27\%$) systematic normalization uncertainty*
- No evidence for P_c^+ states that were found by LHCb

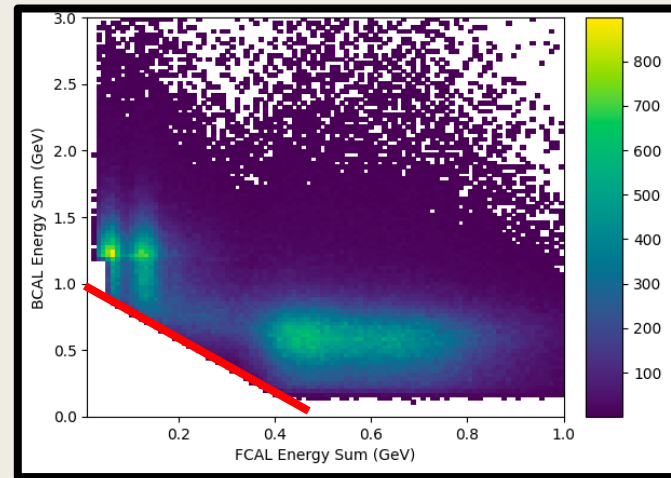

GlueX: PRL 123 (7 Aug. 2019), p. 072001

GlueX: PRL 123 (7 Aug. 2019), p. 072001

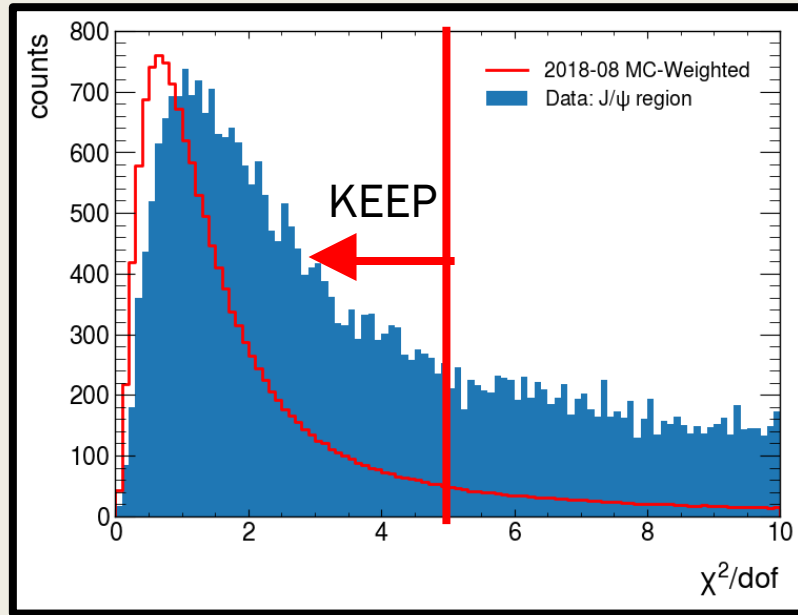

Data Used and Goal of Event Selections

- Proposed exclusive reaction:
 - $\gamma p \rightarrow J/\psi p \rightarrow \mu^+ \mu^- p$
 - Phase-I data: taken from 2017-2018*
 - a luminosity of 304 pb^{-1} above the J/ψ threshold
 - Subset of Phase-II data: taken in 2020*
 - a luminosity of 321 pb^{-1} above the J/ψ threshold

Event Selection	Importance of Selection
$E_{\text{BCAL, total}} > 1.2 \text{ GeV}$ or $E_{\text{BCAL, total}} + 0.5 * E_{\text{FCAL, total}} > 1 \text{ GeV}$	Physics Trigger
Beam Energy $> 8.2 \text{ GeV}$	Removes events below J/ψ threshold
$\chi^2/\text{dof} < 5$	Requires exclusivity and conservation of p^μ
Energy/Path Length in BCAL of $\mu^\pm < .012 \text{ GeV/cm}$	Distinguishes between muons and pions
Energy in FCAL of $\mu^\pm < 1 \text{ GeV}$	
$\theta(\mu^\pm) < 12.5^\circ$ and $\theta(\mu^\pm) < 40^\circ$	Removes pion events formed by baryon decay

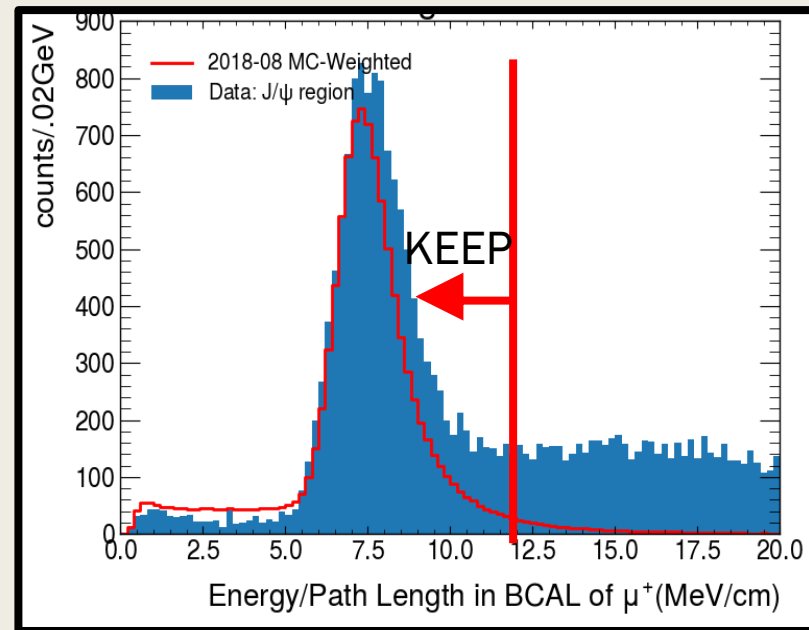

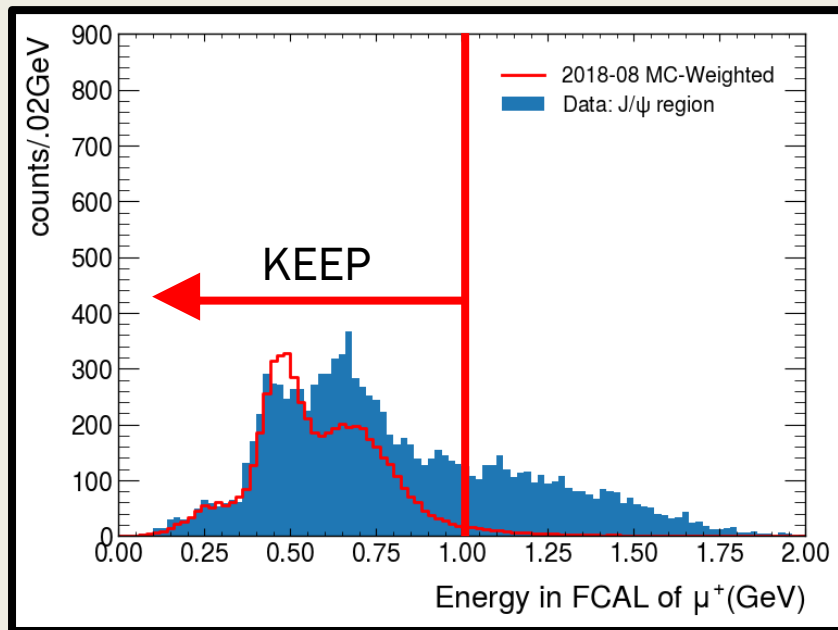

Event Selections- χ^2/dof

- Used to determine the exclusivity of an event
- In the J/ψ region
 - *A long tail in data, probably from events with extra, undetected particles*
- The red line signifies my selection
 - *Did some studies to optimize the chosen selection*

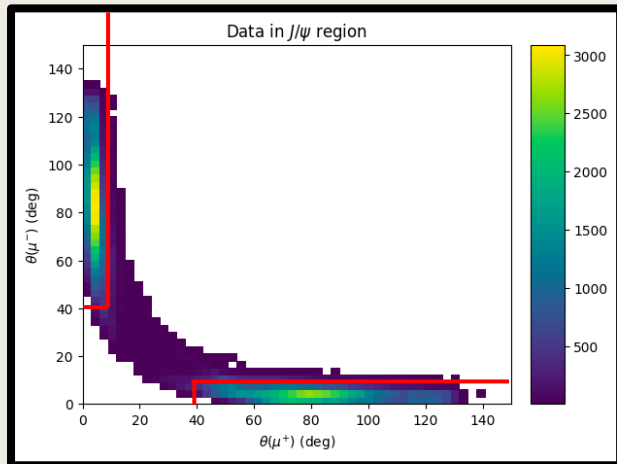

Event Selections- BCAL and FCAL selections

New MC

- With corrections to the MC simulations, much better matching in J/ψ region
 - Differences mostly from large pion background
 - Make loose selections to mitigate differences
- Keep events to the left of the red line

New θ cut- Theta Distributions

- Comparing data to MC
 - Muons tend to have smaller angles
- Pions from baryon decay
 - One pion has large θ in the lab frame
 - Expect the large angles to be from misidentified pions
 - For instance:
 - $\gamma p \rightarrow \Delta^{++} \pi^- \rightarrow (\pi^+ p) \pi^-$
 - $\gamma p \rightarrow \Delta^0 \pi^+ \rightarrow (\pi^- p) \pi^+$
 - $\gamma p \rightarrow N^* \pi^+ \rightarrow (\pi^- p) \pi^+$
- Theta Cut: $\theta(\mu^\pm) < 12.5^\circ$ and $\theta(\mu^\mp) < 40^\circ$

Previous Measurements: J/ψ – 007 Experiment

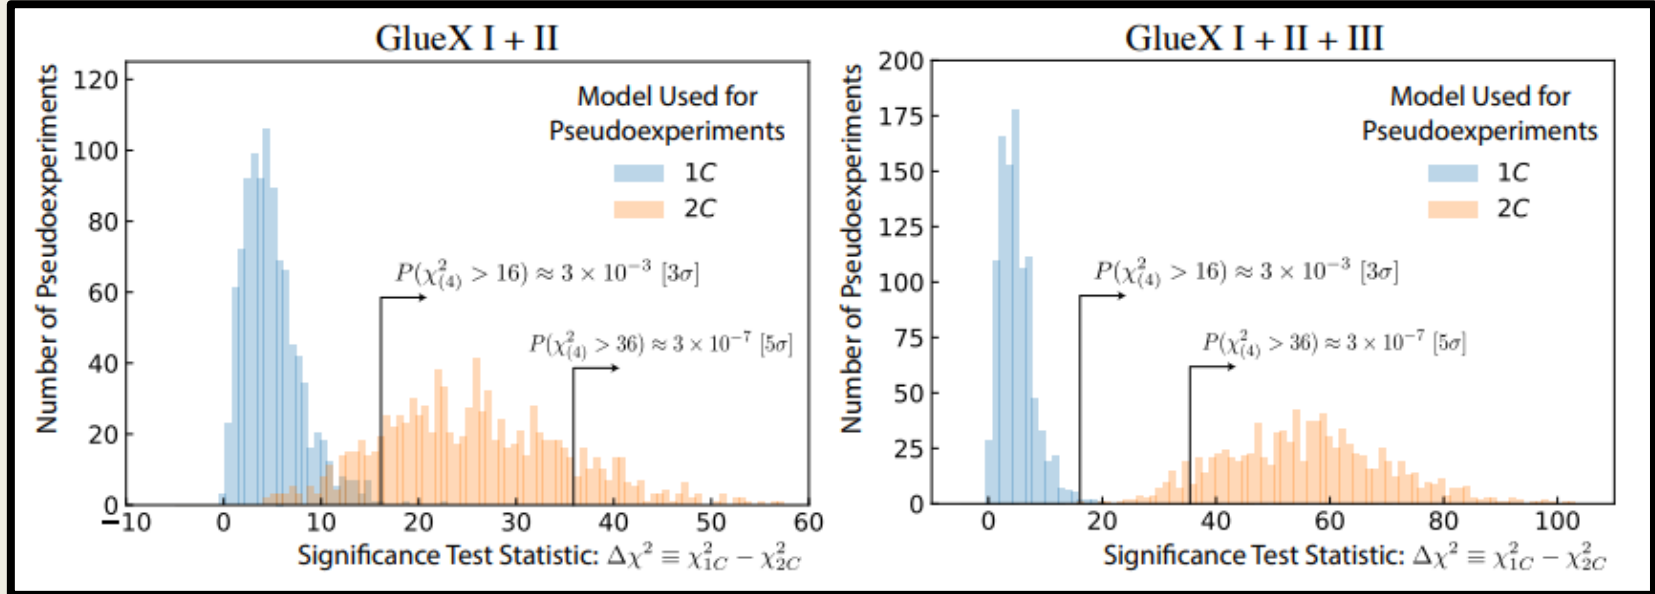

- Located in Hall C of Jefferson Lab.
- Inclusive measurement of J/ψ differential cross section through $J/\psi \rightarrow e^+ e^-$

Duran, B., Meziani, Z.E., Joosten, S. et al. Determining the gluonic gravitational form factors of the proton. *Nature* 615, 813–816 (2023)

GlueX Phase-III

- Plots of the χ^2 difference for 1C ($J/\psi p$ interaction) and 2C ($J/\psi p$ and $\bar{D}^* \Lambda_c$) JPAC model
- Shows a high likelihood that added GlueX-III data could rule out the 1C model at the 5σ level
